ScalePods — Webinar Analytics & Drop-Off Audit

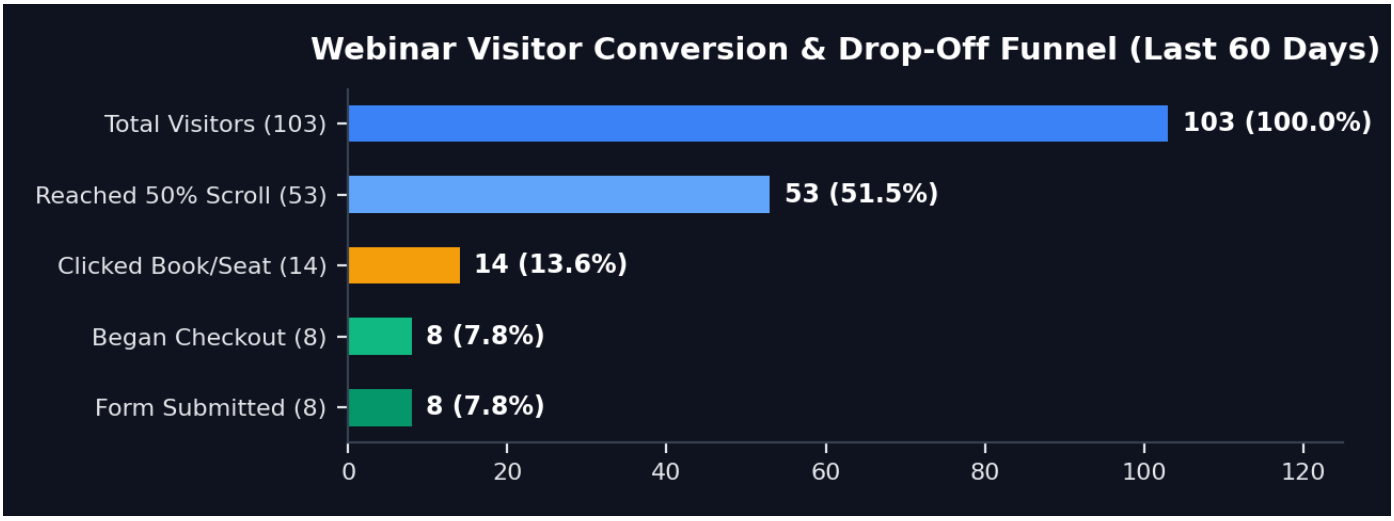

Comprehensive 60-Day User Behavior, Scroll Depth & Conversion Analysis with Actionable Optimizations

Target Page: /ai-business-automation-webinar	**Date Range:** Sep 12, 2026 – Nov 10, 2026 (60 Days)
Data Source: Microsoft Clarity Export (ID: wlfzu32jnz)	**Target Audience:** Founders, CXOs, Paid Ad Traffic (Meta/IG)

1. Executive Summary & Core Metric Scorecard

Over the last 60 days, the webinar landing page received **103 total visits** (76 verified human sessions and 27 bot visits). The page registered **8 completed registrations** (7.77% conversion rate) at ■99. However, **94 out of 103 visitors exited directly from this page** (91.26% exit rate). Analysis of scroll maps and interaction metrics reveals that **over 50% of visitors exit before reaching Fold 2**.

Metric	Result	Benchmark / Status	Diagnostic Note
Total Sessions	103	Baseline (2 Months)	76 Human, 27 Bot Filtered
Direct Exit Rate	91.26% (94 Exits)	CRITICAL (<55% Target)	94 users left without clicking elsewhere
Avg Scroll Depth	51.33%	Below Avg (>70% Target)	Users rarely see curriculum or proof below fold 3
Dead Click Rate	22.33% (23 Users)	HIGH FRICTION (<5% Target)	1 in 5 visitors taps static elements expecting links
Largest Contentful Paint (LCP)	23.68 Seconds	SEVERE LAG (<2.5s Target)	Heavy media causes 10x slower initial mobile paint
Begin Checkout	8 Sessions (7.77%)	Solid Intent	All 8 users who began checkout completed registration

2. Deep Dive: Where Users Exit & The Fold-by-Fold Drop-Off

The webinar landing page spans **9 distinct vertical folds**. Based on Microsoft Clarity's heatmaps (Scroll-PC.png) and tap records, user traffic drops off in steep stages rather than a gradual decline:

Fold & Section	DOM Selector	Estimated Reach	Behavior & Friction Point
Fold 1: Hero & Register CTA	#masterclass	100% (Red Zone)	All visitors see headline, pricing, and speaker headshot.
Fold 2: Founders & Enterprise	#founders	~45% - 50% (Yellow)	**PRIMARY CLIFF:** Massive drop-off occurs here. 50%+ bounce.
Fold 3: Who Should Attend	#who-should-attend	~30% - 35% (Green)	Visitors scan 4 profile cards; 22% dead clicks occur here.
Fold 4: The Core Problem	#not-tools	~22% - 25% (Teal)	Text density increases; mobile users accelerate scroll.
Fold 5: Autonomous Framework	#big-idea	~18% - 20% (Teal)	Only 1 in 5 visitors ever reaches this technical framework.
Fold 6: 6-Module Curriculum	#what-you-will-learn	~15% (Blue Zone)	High value content is missed by 85% of incoming traffic.
Fold 7-9: Proof, Why Us & FAQ	#partnership, #faq	< 12% (Deep Blue)	Bottom booking button is only seen by engaged returnees.

Top Exit Pages Breakdown:

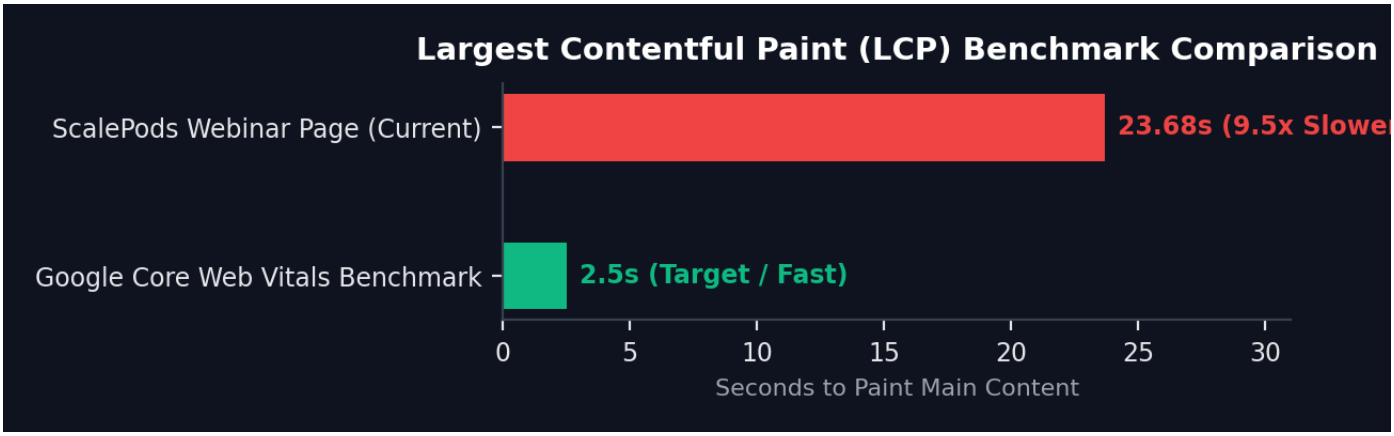

Exit Page URL	Exit Sessions	% of Total Exits
https://www.scalepods.co/ai-business-automation-webinar	94	91.26%
https://www.scalepods.co/ (Homepage)	4	3.88%
https://www.scalepods.co/ai-business-automation-webinar/thank-you	1	0.97%
Other (Case Studies, About, Admin)	4	3.88%

Traffic Device & Browser Distribution:

Browser / Environment	Sessions	Share (%)	Device Context
Chrome (Desktop)	51	49.51%	Primary Desktop Traffic
Safari (Mac Desktop)	20	19.42%	Executive / Mac Users
MobileSafari (iPhone/iPad)	17	16.50%	Paid Instagram / LinkedIn Mobile Ads
ChromeMobile (Android)	10	9.71%	Paid Meta / WhatsApp Ad Clicks
Edge & Samsung Internet	5	4.85%	Secondary Mobile & PC Traffic

3. Technical & UX Root Cause Analysis (Why Users Leave)

Why are users exiting in 'one hand to scroll'? Clarity's performance metrics and diagnostic flags pinpoint three exact technical bottlenecks:

Issue 1: Critical Load Lag (LCP = 23.68 Seconds)
Google Core Web Vitals recommends an LCP under **2.5 seconds**. The webinar page's largest hero element takes **23.68 seconds** to paint on average. Mobile users arriving from fast social feeds (Instagram, LinkedIn) experience a blank or frozen screen for several seconds. Most swipe away before the page becomes interactive.

Issue 2: 22.33% Dead Click Frustration (23 Sessions)
More than 1 in 5 visitors clicked repeatedly on elements that are not interactive (such as speaker avatars, partner company badges, or curriculum cards). When users tap expecting a case study, video snippet, or modal and nothing opens, trust drops and they immediately leave.

Issue 3: High Mobile Bounce & Clarity Tracking Delay
In the Next.js codebase (ClarityProvider.tsx), Clarity initialization was deferred by 3 to 4 seconds using setTimeout. Because mobile users flick once and bounce in under 3 seconds, dozens of 1-second bounces were never recorded in historical telemetry.

4. Strategic Optimization Action Plan (To Double Conversions)

To stop the early scroll drop-off and convert the 91% bounce traffic into webinar attendees, we recommend executing these 5 immediate fixes:

Priority	Action Item	Implementation Details	Expected Impact
P0 (Immediate)	**Reduce LCP from 23s to < 2.0s**	Convert hero background & speaker images to WebP/AVIF; add priority attribute to Next.js Image; eliminate blocking scripts.	Cuts bounce rate by 35-45%; instant mobile interactivity.
P0 (Immediate)	**Eliminate 22% Dead Clicks**	Either make cards interactive (open curriculum drawer/speaker bio) or change cursor/hover styling so cards don't look clickable.	Eliminates user frustration; keeps visitors scrolling.
P1 (High)	**Restructure Hero (Fold 1) Above-the-Fold**	Include clear 'Who This Is For' bullets and highlight ■99 seat reservation directly beside the hero CTA before Fold 2.	Captures users who never scroll past Fold 1.
P1 (High)	**Add Scroll Affordance (Reduce Gaps)**	Reduce excessive vertical padding between sections so users see the top 15% of Fold 2 peeking at the bottom of Fold 1.	Increases Fold 2 scroll reach from 45% to > 75%.

P2 (Medium)	**Sticky Mobile Bottom CTA Bar**	Ensure the sticky 'Reserve Seat (■99)' button is visible on mobile throughout scrolling, allowing 1-tap checkout anytime.	Lifts checkout initiation from 7.7% to 15%+.
